Contributing to Development Cooperation with Consulting Experience in 88 Countries and Worldwide Network

Human Environment in harmony with SDGs

The environment surrounding us is changing day by day, due to the impacts of climate change, natural disasters and global security. In response to facing such various challenges, we utilize the knowledge and technology of our experts to make the best future-oriented proposals for countermeasure planning and problem solving.

Cooperation with Worldwide Network

INGÉROSEC working in partnership with INGÉROP, a leading French consulting firm, aims to demonstrate synergistic effects and create new values, by collaborating with INGÉROP's group network worldwide.

Public Infrastructure

In the fields of civil engineering such as construction of roads and bridges, and social infrastructure development such as procurement of fire engines and demining equipment, we provide comprehensive consulting services and project management for all stages from research, design to construction/procurement supervision. Furthermore, we also participate in technical cooperation projects aiming to improve the capabilities of local governments for sustainable public infrastructure maintenance.

Development and Evaluation

For sustainable development of socio-economic structures from community to national level, we provide consulting services from project formation to a cycle of implementation-monitoring-evaluation-improvement. Our consulting covers a wide range of fields, such as urban transportation improvement, clean energy introduction and tourism development.

Business Support for SMEs^{※1}

By utilizing our local networks, we support developing countries and emerging countries with dissemination of Japanese products and technologies. We also lead Japanese companies to their successful overseas business expansion, with our accumulated knowledge, information and know-how of international operations, as well as consistent backup for business planning, survey, verification test and development.

Technical Approach with BIM/CIM^{※2}

BIM/CIM is an initiative to improve the efficiency and visualization of operations, by accumulating and managing 3D models and integrated data that connects various information on a computer network. As international standards are being developed for full-scale social implementation, we are pioneering this technology and applying it to various projects to promote technological innovation.
